Education and positions

- 2013- Assistant Professor, Physiology, Biophysics, and Systems Biology Program, Weill Cornell Graduate School of Medical Sciences
- 2012- Assistant Member, Memorial Sloan-Kettering Cancer Center
- 2008-2012 Independent Distinguished Postdoctoral Fellow, California Institute for Quantitative Biosciences (QB3), University of California, Berkeley
- Independent research funding, sponsors [Phillip L. Geissler](#) and [Susan Marqusee](#)
- 2006-2008 Postdoctoral researcher, Department of Chemistry, Stanford University
- With [Vijay S. Pande](#) (head of [Folding@Home](#) distributed computing project)
- 1999-2006 Ph.D. in Biophysics, University of California, San Francisco
- Committee: [Ken A. Dill](#), [Matthew P. Jacobson](#), [Vijay S. Pande](#)
- 1995-1999 B.S. in Biology, California Institute of Technology
- Undergraduate research with [Paul H. Patterson](#) (*experimental molecular neurobiology*) and Jerry E. Solomon (*computational chemistry*)

Fellowships and awards

- 2017 Silicon Therapeutics Open Science Fellowship
- 2013-2016 Louis V. Gerstner Young Investigator Award
- 2013-2014 Google Exacycle for External Faculty
- 2008-2012 QB3-Berkeley Distinguished Postdoctoral Fellowship, University of California, Berkeley
- 2005-2006 IBM Predoctoral Fellowship
- 2005 Frank M. Goyan Award for outstanding work in physical chemistry, University of California, San Francisco
- 2000-2005 Howard Hughes Medical Institute Predoctoral Fellowship

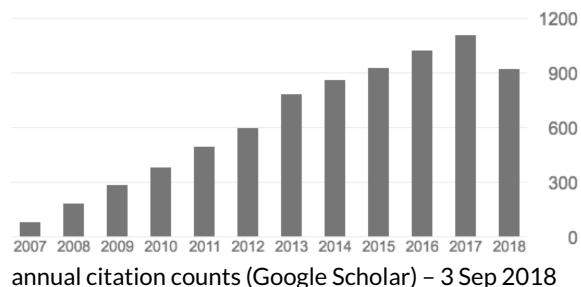

Research overview

My research focuses on **redesigning the way we develop small molecules for chemical biology and drug discovery** and **bringing rigorous atomistic modeling into the high-throughput biology and genomics era**. By combining novel algorithmic advances to achieve orders-of-magnitude efficiency gains with powerful but inexpensive GPU hardware and distributed computing technologies, I am developing a new generation of tools and open source software packages for predicting small molecule binding affinities, designing small molecules with desired properties, quantifying drug sensitivity or resistance of clinical mutations, and understanding the detailed structural mechanisms underlying oncogenic mutations. As a core member of the [Folding@home Consortium](#), my lab harnesses the computing power of hundreds of thousands of volunteers around the world to study functional implications of mutations and new opportunities for therapeutic design against cancer targets. Using automated biophysical measurements, we collect new experimental data targeted to advance the quantitative accuracy of our methodologies, and gather new insight into drug susceptibility and resistance in kinases and other cancer targets. My work makes extensive use of scalable Bayesian statistical inference methods and information theoretic principles for designing experiments and quantifying error. I am passionate about open science, disseminating software engineering best practices, and maximizing research reproducibility.

The dynamic conformational landscapes of the protein methyltransferase SETD8

In this work, we show how targeted X-ray crystallography using covalent inhibitors and depletion of native ligands to reveal structures of low-population hidden conformations can be combined with massively distributed molecular simulation to resolve the functional dynamic landscape of the protein methyltransferase SETD8 in unprecedented atomistic detail. Using an aggregate of six milliseconds of fully atomistic simulation from Foldinghome, we use Markov state models to illuminate the conformational dynamics of this important epigenetic protein.

What makes a kinase promiscuous for inhibitors?

Using a combination of chemogenomics, structural biology, and molecular simulation approaches, we identify a set of human kinases that are especially promiscuous binders of small molecule kinase inhibitors, and show that a prototypical member of this class, DDR1, achieves this promiscuity by virtue of its more stable Asp-DFG-out conformation.

Overview of the SAMPL6 host-guest binding affinity prediction challenge

We present an overview of the host-guest systems and participant performance for the SAMPL6 host-guest blind affinity prediction challenges, assessing how well various physical modeling approaches were able to predict ligand binding affinities for simple ligand recognition problems where receptor sampling and protonation state effects are eliminated due to the simplicity of supramolecular hosts. We find that progress is now stagnated likely due to force field limitations.

Sivak DA, Chodera JD, and Crooks GE

Using nonequilibrium fluctuation theorems to understand and correct errors in equilibrium and nonequilibrium discrete Langevin dynamics simulations

All molecular dynamics simulations introduce error into the sampled distribution by virtue of the finite timestep used to integrate the equations of motion on a digital computer. While traditional approaches to analyzing this error are extremely complicated, we show how interpreting finite-timestep integrators as a form of nonequilibrium driving leads to simple, straightforward schemes for assessing the impact of these errors, as well as correcting for them.

Bayesian hidden Markov model analysis of single-molecule biophysical experiments

We present a Bayesian hidden Markov model analysis scheme that allows biomolecular conformational dynamics—and the corresponding uncertainty due to limited data—to be inferred from single-molecule trajectories. This approach was developed for a single-molecule study examining folding dynamics of nascent proteins exiting the ribosome [Science 334:1723, 2011 · [DOI](#)].

NIH R01 GM121505-01

The role of reorganization energy in achieving selective kinase inhibition

The goal of this project is to probe the role of protein reorganization energy in achieving selectivity in targeted kinase inhibition with small molecules.

9/15/2017 – 9/14/2022

\$196,250 annual direct costs, plus \$100,073 administrative supplement awarded in 2018

NSF D3SC EAGER CTMC

A probabilistic framework for automated forcefield parameterization from experimental datasets

The goal of this project is to develop a scalable Bayesian inference infrastructure to parameterize molecular mechanics forcefields using experimental datasets.

9/1/2017 – 8/31/2019

\$52,030 annual direct costs

Merck KGaA Collaboration

Developing automated workflows for absolute alchemical free energy calculations

The goal of this project is to develop open source automated workflows using absolute alchemical free energy calculations for use in prioritizing compounds for synthesis in drug discovery applications.

7/26/2016 – 1/25/2019

\$90,273 annual direct costs

Silicon Therapeutics Collaboration

Development of efficient open source free energy based lead optimization algorithms

The goal of this project is to develop open source scalable parallel workflows for lead optimization using relative alchemical free energy calculations.

5/17/2017 – 11/17/2018

\$48,655 annual direct costs

Relay Therapeutics Collaboration

Development of efficient open source cloud-enabled free energy based lead optimization algorithms and integrative Bayesian model of experimental biophysical and molecular simulation data

The goal of this project is to develop open source scalable cloud workflows for lead optimization using relative and absolute alchemical free energy calculations, as well as Bayesian integrative modeling techniques for experimental biophysical data and molecular simulations.

4/5/2018 – 4/5/2019

\$74,074 annual direct costs

Entasis Therapeutics Collaboration

Development of efficient equilibrium and nonequilibrium algorithms for predicting small molecule porin permeation with potential of mean force methods

The goal of this project is to develop algorithms and open source tools for efficient equilibrium and nonequilibrium potential of mean force calculations for bacterial porins.

4/5/2018 – 4/5/2019

\$74,074 annual direct costs

Parker Institute for Cancer Immunotherapy Pilot Grant

Physics-based computational prediction of cancer-associated mutant MHC class II epitopes

The goal of this project is to develop algorithms and open source tools for efficient computation of MHC class II epitope binding affinities.

4/2/2018 – 4/1/2019

\$75,000 annual direct costs

Fellowships

Rafal P. Wiewiora, TPCB Graduate Student
DOD Peer-Reviewed Cancer Research Program Award
8/15/2017 – 8/14/2019
direct costs: \$75,000/year for stipend and supplies

Chaya Stern, TPCB Graduate Student
MolSSI Phase I Fellowship
7/1/2018 – 12/31/2018
direct costs: \$40,000/year stipend

Andrea Rizzi, CBM Graduate Student
Tri-I CBM Student Stipend Assistance
direct costs: \$13,500/year stipend support

Marcus Wieder, Postdoctoral Research Fellow
Austrian Schrödinger Stipendium
10/1/2018 – 9/30/2019
direct costs: Fellowship recipient direct paid

Simon Boothroyd, Postdoctoral Research Fellow
XtalPi / Open Force Field Consortium Distinguished Postdoctoral Fellowship
10/1/2018 – 9/30/2019
direct costs: Fellowship recipient direct paid

Collaborative Grants

1R01GM124270-01A1 (PI: Mobley, UCI)
Advancing predictive physical modeling through focused development of model systems to drive new modeling innovations
The goal of this project is to enable blind community challenges that drive progress toward quantitative accuracy in the field of computational physical modeling of drug-receptor interactions.
10/1/2018 – 9/31/2023
direct costs: awaiting NoA from NIH

PENDING

Single-Investigator Grants and Contracts

BIH Einstein Visiting Professorship at the Charité Berlin

Computational polypharmacology: A new paradigm for selectively promiscuous kinase inhibitors

The goal of this project is to develop structure-informed machine learning approaches to predicting kinase inhibitor polypharmacology for computer-guided small molecule design.

11/1/2018 – 10/31/2021

EUR150,000 annual direct costs to Chodera for Berlin working group

Fellowships

Andrea Rizzi, CBM Graduate Student

MolSSI Phase II Fellowship

1/1/2019 – 12/31/2019

direct costs: \$40,000/year stipend

Collaborative Grants

NIH Focused Technology Development R01 1R01GM132386 (PIs: Chodera, MSKCC and Shirts, U Colorado)

Open data-driven infrastructure for building biomolecular force fields for predictive biophysics and drug design

The goal of this project is to develop a modern open infrastructure for building fully consistent biopolymer and small molecule force fields for drug design and predictive biophysical modeling.

5/1/2019 – 4/30/2023

\$105,000 annual direct costs to Chodera

NSF Expeditions in Computing (PI: Edward Dougherty, Texas A&M)

NSF 18-528 – CCF – Experimental Expeditions

Expeditions: Achieving Computational and Engineering Objectives Under Uncertainty – Optimal Operational and Experimental Design

The goal of this project is to develop optimal adaptive methods for experimental design under uncertainty using operator methods, with multiple applications including drug discovery.

12/1/2019 – 11/30/2024

\$72,801 annual direct costs to Chodera

NIH 1R01CA232025-01 (PI: Daniel Heller, MSKCC)

Targeted delivery of kinase inhibitors to RAS-driven GI tumors

The goal of this project is to develop predictive computational models for the design and optimization of nanoparticles for the targeted delivery of selective kinase inhibitors.

7/1/2018 – 6/31/2023

\$450,000 annual direct costs / \$43,814 annual direct costs to Chodera

NIH 1R01GM124270-01A1 (PI: David Mobley, UCI)

Advancing predictive physical modeling through focused development of model systems to drive new modeling innovations

The goal of this project is to enable blind community challenges that drive progress toward quantitative accuracy in the field of computational physical modeling of drug-receptor interactions.

4/1/2018 – 3/31/2023

\$314,346 annual direct costs / \$93,110 annual direct costs to Chodera

NIH 1R01GM124150-01A1 (PI: Nicholas Levinson, UMN)

Unraveling multifaceted allosteric regulation in Aurora kinase through coupled experiment and theory

The goal of this project is to understand the mechanism of complementary mechanisms of Aurora activation

12/1/2017 – 11/30/2022

\$372,047 annual direct costs / \$90,878 annual direct costs to Chodera

NIH 1R01GM123183-01A1

Protonation state effects in selective kinase inhibitor recognition

The goal of this project is to characterize the role of protonation state effects in selective kinase inhibitor recognition and explore ramifications for selective inhibitor design.

co-Is: Markus Seeliger (Stony Brook); Marilyn Gunner (CCNY)

7/1/2017 – 6/30/2022

\$344,109 annual direct costs / \$187,109 annual direct costs to Chodera

2014 Functional Genomics Initiative (PI: James Hsieh, MSKCC)

Characterization of Cancer-derived mTOR Mutations for Precision Therapeutics

The goal of this project is to understand the mechanism underlying clinically-identified mTOR activating mutants

and evaluate the potential for rapalog therapy to aid the 2% of cancer patients harboring mTOR mutations.

5/1/2015 – 4/30/2017

\$118,000

2014 STARR Cancer Consortium (PI: Minkui Luo, MSKCC)

Designing sinefungin scaffolds as specific protein methyltransferase inhibitors

The goal of this project is to use computational techniques that explicitly incorporate protein flexibility to design selective inhibitors for protein lysine methyltransferases.

1/1/2015 – 6/30/2017

\$125,000

Personnel

CURRENT MEMBERS

Postdocs

- Ana Silveira, PhD Federal University of Rio de Janeiro (8/1/2018–)
Integrative modeling of allosteric inhibition; modeling antimicrobial permeation of bacterial porins
- Marcus Wieder, PhD University of Vienna (9/1/2018–)
Modeling tautomer shifts upon binding of small druglike molecules

Graduate Students

- Patrick B. Grinaway (7/1/2013–5/31/2018 anticipated)
Program in Physiology, Biophysics, and Systems Biology (PBSB)
Automated lead optimization informed by synthetic accessibility; Relative free energy calculations
- Ariën Sebastian Rustenburg (10/1/2013–9/30/2018 anticipated)
Program in Physiology, Biophysics, and Systems Biology (PBSB)
Constant-pH dynamics; protonation states effects in kinase inhibitors via experiment and theory
- Chaya Stern (4/01/2014–12/31/2018 anticipated)
Tri-Institutional Training Program in Chemical Biology (TPCB)
Analysis of single-molecule biophysical experiments; Bayesian inference for forcefield parameterization
- Mehtap Isik (6/1/2015–12/31/2019 anticipated)
Tri-Institutional Training Program in Chemical Biology (TPCB)
Model experiemntal systems for protein-small molecule recognition; targeted nanoparticle design
- Rafal Wiewiora (6/1/2015–9/31/2019 anticipated)
Tri-Institutional Training Program in Chemical Biology (TPCB)
Design of selective inhibitors for protein methyltransferases; Markov state modeling
- Steven Albanese (6/1/2015–9/31/2018 anticipated)
Gerstner Graduate Program (GSK)
Free energy calculations to predict kinase inhibitor selectivity and resistance; Biophysics of kinase activation
- Andrea Rizzi (9/1/2015–12/31/2018 anticipated)
Tri-Institutional Program in Computational Biology and Medicine (CBM)
Quantitatively accurate alchemical free energy calculations for kinase inhibitor design
- Joshua Fass (9/1/2015–3/31/2019 anticipated)
Tri-Institutional Program in Computational Biology and Medicine (CBM)
Machine learning and statistical inference for biomolecular dynamics and forcefield parameterization

Technicians

- Erin Grundy (6/1/2018–)
Automated human kinase expression and measurements of small molecule kinase inhibitor affinities to mutant kinases

PAST TRAINEES

Postdocs

- Levi N. Naden (until 8/10/2018)
Current position: *Software Scientist at the NSF-sponsored Molecular Sciences Software Institute (MoSSI)*
- Sonya M. Hanson (until 6/30/2017)
Current position: *Postdoctoral Researcher with Joachim Frank, Columbia University*
- Gregory Ross (until 6/30/2017)
Current position: *Senior Scientist, Free Energy Methods, Schrödinger*
- David W. H. Swenson (until 12/30/2015)
Current position: *Postdoctoral Researcher, Universiteit von Amsterdam*
- Daniel L. Parton (until 8/31/2015)
Current position: *Lead Data Scientist, Bardess Group*
- Kyle A. Beauchamp (until 6/12/2015)
Current position: *Computational Research Scientist, CounsyI*
- Jan-Hendrik Prinz (until 1/30/2015)
Current position: *Digital Solutions Architect, Keylight GmbH*
- Sarah E. Boyce (until 10/31/2013)
Current position: *Senior Scientist, Drug Discovery Group, Schrödinger*

Graduate Students

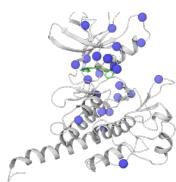

- Julie M. Behr (1/10/2014–12/31/2016)
Tri-Institutional Program in Computational Biology and Medicine (CBM)
Current position: *Transferred to Imielinski lab after publishing three papers with the Chodera lab*

Technicians

- Lucelenie Rodriguez (7/1/2015–12/31/2016; 12/4/2017–7/20/2018)

Hauser K, Negron C, Albanese SK, Ray S, Steinbrecher T, Abel R, and Chodera JD, and Wang L

Predicting resistance of clinical Abl mutations to targeted kinase inhibitors using alchemical free-energy calculations

The emergence of resistance mutations are a significant problem in precision cancer therapy. With cancer centers now routinely collecting tumor sequencing panels, it is apparent the vast majority of missense mutations in kinases—for which more than 36 small molecule inhibitors are available—are very rare, and no information will be available as to whether these mutations might reduce therapeutic efficacy for some inhibitors by inducing drug resistance. Here, we take the first steps toward using physical modeling to predict individualized therapeutic response, assessing how accurately the impact of clinical Abl mutations on inhibitor binding affinity can be predicted. Our results suggest free energy calculations are a promising tool for aiding therapeutic decisionmaking.

A dynamic mechanism for allosteric activation of Aurora kinase A by activation loop phosphorylation

Kinase phosphorylation is canonically believed to induce a conformational change of the DFG loop that borders the ATP binding site from out to in. Surprisingly, it seems that not all kinases behave this way. Through a combination of FRET, IR, and EPR labeling and large-scale molecular dynamics simulations, we show that phosphorylation activates Aurora kinase by a novel mechanism that does not simply correspond to a DFG-out to DFG-in population shift, but rather reorganization of DFG-in subpopulations. This paper follows our prior report in Nature Chemical Biology on the role of Tpx2 in activating a cellular subpopulation of Aurora by another surprising mechanism.

Ensembler: Enabling high-throughput molecular simulations at the superfamily scale

Traditionally, biomolecular simulations has focused on the study of one protein at a time. In the modern genome-enabled, high-throughput world, however, there is much to be gained by studying entire families, superfamilies, or mutational variants at the same time. To overcome the lack of tools in our field to make this possible, we developed a new high-throughput pipeline to enable massively parallel molecular simulation studies of biomolecular dynamics at the superfamily scale, illustrating its application to protein tyrosine kinases, an important class of drug targets in cancer.

Journal of Computer Aided Molecular Design 27:989–1007, 2013 · [DOI](#)

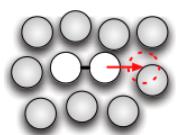

Wang K, Chodera JD, Yang Y, and Shirts MR

Identifying ligand binding sites and poses using GPU-accelerated Hamiltonian replica exchange molecular dynamics

This paper was the first to demonstrate how GPU-accelerated molecular dynamics can be used to compute binding free energies, using Hamiltonian replica exchange methodologies that are now in standard use in drug discovery through both academic codes and commercial products, such as Schrodinger FEP+. In addition, we demonstrated how we could use this technique to identify binding sites that may be previously unknown.

Nonequilibrium candidate Monte Carlo is an efficient tool for equilibrium simulation

We present a significant generalization of Monte Carlo methods that provide an enormously useful tool for enhancing the efficiency of molecular simulations and enabling molecular design. This technique allows astronomical increases in acceptance rates—such as efficiency gains of 10^{30} —allowing efficient Monte Carlo proposals for part of the system to be effectively mixed with molecular dynamics. This approach is now allowing our lab to dynamically treat protonation states, insert/delete counterions, rapidly reorient ligands in binding sites, and sample over chemical species within a single simulation.
