Education and positions

2023-	Member, Memorial Sloan-Kettering Cancer Center
2019–2023	Associate Member, Memorial Sloan-Kettering Cancer Center
2019–	BIH Einstein Visiting Professor, Charité, Berlin
2013–	Faculty, Physiology, Biophysics, and Systems Biology Program, Weill Cornell Graduate School of Medical Sciences
2012–2019	Assistant Member, Memorial Sloan-Kettering Cancer Center
2008–2012	Independent Distinguished Postdoctoral Fellow, California Institute for Quantitative Biosciences (QB3), University of California, Berkeley
2007–2008	Independent research funding, sponsors Phillip L. Geissler and Susan Marqusee Postdoctoral researcher, Department of Chemistry, Stanford University With Vijay S. Pande (head of Folding@Home distributed computing project)
1999–2006	Ph.D. in Biophysics, University of California, San Francisco Committee: Ken A. Dill , Matthew P. Jacobson , Vijay S. Pande
1995–1999	B.S. in Biology, California Institute of Technology Undergraduate research with Paul H. Patterson (<i>molecular neurobiology</i>) and Jerry E. Solomon (<i>computational chemistry</i>)

Fellowships and awards

2022–2024	Einstein Visiting Fellowship
2019–2022	BIH Einstein Visiting Fellowship
2017	Silicon Therapeutics Open Science Fellowship
2013–2016	Louis V. Gerstner Young Investigator Award
2013–2014	Google Exacycle for External Faculty
2008–2012	QB3-Berkeley Distinguished Postdoctoral Fellowship, University of California, Berkeley
2005–2006	IBM Predoctoral Fellowship
2000–2005	Howard Hughes Medical Institute Predoctoral Fellowship

Research overview

My lab is developing the infrastructure to enable fully autonomous small molecule drug discovery powered by next-generation hybrid physical/machine learning models to predict potency, selectivity, and resistance in a data-efficient manner. We develop advanced predictive computational methodologies for drug discovery in frontier areas where these models are lacking, working with industry collaborators to deploy those solutions in real drug discovery programs. We build open source tools—such as [OpenMM](#), which has been downloaded over 1.2 million times, run on millions of machines, and powers advances such as AlphaFold—that enable these algorithms to have impact across the drug discovery and biomolecular modeling fields. We create open science communities—such as (1) the [Open Force Field Initiative](#), (2) the [COVID Moonshot](#) (which delivered a patent-free COVID antiviral preclinical candidate into an IND-enabling preclinical program funded by the Wellcome Trust), (3) the [Folding@home Consortium](#) which harnesses hundreds of thousands of volunteer computers around the world to accelerate biomolecular simulation and discovery, and (4) the [AI-driven Structure-enabled Antiviral Program](#) that received \$68M in initial funding from the NIH for open science antiviral drug discovery. We apply these tools to cancer, where we develop models for (1) designing small molecule kinase inhibitors with targeted polypharmacology, (2) predicting drug sensitivity or resistance of clinical mutations, and (3) understanding the detailed structural mechanisms underlying oncogenic mutations. And we train the next generation of interdisciplinary scientists equipped to tackle the most challenging problems in health and human disease for industrial drug discovery.

Major Research Collaborations

The COVID Moonshot (2020–) · <https://covid.postera.ai/covid>

I co-founded the **COVID Moonshot**, a global open science collaboration leveraging our free alchemical energy calculations on **Folding@home** to discovery a patent-free oral antiviral useful against COVID-19. Starting from an X-ray fragment screen, we produced SARS-CoV-2 main viral protease (Mpro) inhibitor preclinical candidates in just 18 months ([Nature Comment](#)). Together with the [Drugs for Neglected Diseases initiative \(DNDi\)](#)—the world's leading nonprofit developing new therapies for neglected diseases—we were awarded \$11M from the WHO Access to COVID Tools Accelerator (ACT-A) via the [Wellcome Trust](#) to carry out an accelerated preclinical program, with clinical trials expected in early 2024. Our antiviral is expected to be free of the drug-drug interactions that present difficulties to widespread use of Paxlovid, and has differentiated resistance liabilities. We are working to partner with generics manufacturers to make our antiviral available for globally equitable and affordable access.

AI-driven Structure-enabled Antiviral Platform (ASAP) (2022–) · <https://asapdiscovery.org>

Together with [DNDi](#) and [PostEra](#), I lead the **AI-driven Structure-enabled Antiviral Platform**, which uses artificial intelligence and computational chemistry to accelerate structure-based open science antiviral drug discovery and deliver oral antivirals for pandemics with the goal of global, equitable, and affordable access. I am the Contact PI on the [NIH NIAID Antiviral Drug Discovery \(AViDD\) Center](#) that currently funds ASAP, currently funded by a [\\$68M NIH award for the first three-year phase of a five-year \\$110M grant](#). ASAP is actively pursuing additional funding, including a [EUR22M SPRIND proposal](#) submitted in Mar 2023.

Folding@home Consortium (2012–) · <http://foldingathome.org>

I am a founding member of the **Folding@home Consortium**, a worldwide network of laboratories that run the **Folding@home global distributed computing project** where hundreds of thousands of volunteers around the world (mostly gamers with GPUs) contribute idle computing cycles to enable us to study molecular mechanisms of disease and search for new potential therapeutics. As part of the COVID Moonshot effort, **Folding@home became the world's first exascale distributed computing platform in 2020**. Using our alchemical free energy methodologies on Folding@home, we accelerated lead optimization for preclinical candidates for the COVID Moonshot that are expected to enter clinical trials in 2023.

OpenMM molecular simulation framework (2006–) · <http://openmm.org>

I co-lead the **OpenMM Consortium**, which develops an open source GPU-accelerated molecular simulation package used both as a stand-alone tool for biomolecular simulation and as a library to enable other tools to use biomolecular simulation, such as [Isolde](#) and [AlphaFold2](#). OpenMM is the fastest and most widely deployed GPU-accelerated biomolecular simulation package globally, and has been downloaded over 1.2 million times. OpenMM is currently [funded by the NIH](#) to effect a transformation in the biomolecular simulation community to enable the use of fast, accurate machine-learning force fields.

Open Force Field Initiative and Consortium (2019–) · <http://openforcefield.org>

I co-founded the **Open Force Field Initiative** (an NIH-funded collaboration) and related **Open Force Field Consortium** (funded by over a dozen industry partners), a scientific collaboration consisting of dozens of scientists around the world working to develop modern open source infrastructure for building and applying high-quality biomolecular force fields for accelerating drug discovery. These force fields and tools are used by pharma and academic labs around the world, and recently aided the discovery of a new preclinical candidate by the COVID Moonshot.

Statistical Assessment of the Modeling of Proteins and Ligands (SAMPL) (2012–) · <https://samplchallenges.github.io>

I co-organize the **SAMPL Challenges**, which are iterative blind predictive modeling challenges for the computational chemistry community aimed at accelerating the generation of solutions to major obstacles limiting the progress of computer-aided drug discovery, focusing the community on solving these challenges, providing critical experimental data to computational researchers that lack access to data generation capabilities, and emphasizing knowledge sharing. The learnings from these challenges have been reported in over [14 special issues of the Journal for Computer-Aided Molecular Design](#). In some areas, we have managed to move computational methods for wide disagreement among methods to tightly-grouped predictions that can identify when the experimental data is wrong.

Critical Assessment of Computational Hit-finding Experiments (CACHE) (2022–) · <https://cache-challenge.org/>

I co-founded the **CACHE Challenge**, which aims to be the "CASP for hit-finding in drug discovery" by providing a new generation of AI- and physics-driven approaches to assess and refine their hit identification approaches against experimental data. Each CACHE Challenge focuses on identifying new chemical matter against an orphan target protein of pharmaceutical relevance, and all experimental data and compounds are disclosed into the public domain to accelerate drug discovery against these targets.

Open Molecular Software Foundation (OMSF) (2021–) · <http://openforcefield.org>

I work closely with the **Open Molecular Software Foundation (OMSF)**, a 501(c)3 nonprofit organization that aims to be thoughtful stewards for the biomolecular modeling and computer-aided drug discovery open source software communities. Using a funding mechanism I helped pioneer, OMSF can act as a fiscal sponsor that works with open source software communities in the biomolecular sciences to aid them in becoming self-governing organizations that serve the community with fiscally sustainable support from industrial, federal, and philanthropic sources. OMSF currently hosts the [Open Force Field Initiative and Consortium](#), the [Open Free Energy Consortium](#), and [OpenFold Consortium](#).

Scientific Advisory Board Memberships

One way I work to translate my research into impact is via participating in Scientific Advisory Boards (SABs) for companies using computational chemistry to accelerate drug discovery. Some of the SABs I have served on include:

Schrodinger (2013–2018) · <http://schrodinger.com>

I joined the Schrodinger SAB shortly after their first release of the FEP+ alchemical free energy calculation tool, aiming to ensure the first commercial turnkey product version of my field of alchemical free energy calculations had maximum impact for structure-enabled drug discovery. This effort was highly successful, with FEP+ near-universally used by industry to accelerate structure-enabled drug discovery efforts. I left in 2018 to focus my efforts on new, more scalable technologies and ways to use these tools for frontier problems in drug discovery.

OpenEye Scientific (2018–) · <https://www.eyesopen.com>

I joined the OpenEye SAB excited to help enable an ecosystem of open source computer-aided drug discovery tools and academic research that could rapidly be translated into impactful deployment within both industry and academia using their Orion cloud-based drug discovery platform. OpenEye was recently acquired by Cadence for \$500M.

Interline Therapeutics (2021–) · <https://www.interlinetx.com>

I am a founding SAB member and scientific cofounder of Interline Therapeutics, which has raised \$92M since its inception in 2021. Interline seeks to harness open source alchemical free energy methodologies that I developed to tackle problems in target and conformational selectivity to enable the design of small molecules that modulate protein communities.

Ventus Therapeutics (2021–) · <https://www.ventustx.com>

Ventus is a rapidly growing small molecule discovery company that has raised over \$300M in three funding rounds. In addition to featuring extraordinary medicinal chemistry talent, Ventus has developed a novel computational platform, ReSOLVE, to accelerate novel chemotype hit discovery for new targets. I joined the SAB to advise on the integration of structure-enabled open source computer-aided drug discovery workflows to accelerate hit-to-candidate progression.

Redesign Science (2020–) · <https://www.redesignscience.com>

Redesign Science is a NYC-based startup aiming to commercialize technologies I helped develop as a graduate student—the construction of Markov state models of coarse-grained biomolecular dynamics from distributed biomolecular simulations—to use as a platform to accelerate drug discovery.

Wieder M, Fass J, and **Chodera JD**

Teaching free energy calculations to learn from experimental data

In this pioneering work, we show, for the first time, how we can use machine learning to systematically improve explicit solvent alchemical free energy calculations using fully machine learning force fields by fitting directly to experimental free energies. This is also the first work to show how to compute alchemical free energies in explicit solvent using fully machine learning force fields, and the first to show how this can also involve breaking and forming covalent bonds.

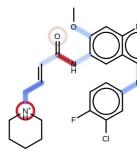

Preprint · [bioRxiv](#)

Rufa DA, Bruce Macdonald HE, Fass J, Wieder M, Grinaway PB, Roitberg AE, Isayev O, and **Chodera JD**

Towards chemical accuracy for alchemical free energy calculations with hybrid physics-based machine learning / molecular mechanics potentials

In this first use of hybrid machine learning / molecular mechanics (ML/MM) potentials for alchemical free energy calculations, we demonstrate how the improved modeling of intramolecular ligand energetics offered by the quantum machine learning potential ANI-2x can significantly improve the accuracy in predicting kinase inhibitor binding free energy by reducing the error from 0.97 kcal/mol to 0.47 kcal/mol, which could drastically reduce the number of compounds that must be synthesized in lead optimization campaigns for minimal additional computational cost.

Preprint · [bioRxiv](#)

Stern CD, Bayly CI, Smith DGA, Fass J, Wang L-P, Mobley DL, and Chodera JD

Capturing non-local through-bond effects when fragmenting molecules for quantum chemical torsion scans

We show how the Wiberg Bond Order (WBO) can be used to construct small molecule fragmentation schemes that will avoid disrupting the chemical environment around torsions. The resulting fragmentation scheme powers the QCSubmit tool used to fragment and inject small molecule datasets into the QCFractal computation pipeline for deposition into the QCArchive quantum chemistry archive the Open Force Field Initiative uses for constructing force fields, as well as powering bespoke torsion refitting for individual molecules.

End-to-end differentiable molecular mechanics force field construction

Molecular mechanics force fields have been a workhorse for computational chemistry and drug discovery. Here, we propose a new approach to force field parameterization in which graph convolutional networks are used to perceive chemical environments and assign molecular mechanics (MM) force field parameters. The entire process of chemical perception and parameter assignment is differentiable end-to-end with respect to model parameters, allowing new force fields to be easily constructed from MM or QM force fields, extended, and applied to arbitrary biomolecules.

SARS-CoV-2 simulations go exascale to predict dramatic spike opening and cryptic pockets across the proteome

To accelerate a multitude of drug development activities to combat the global threat posed by COVID-19, over a million citizen scientists have banded together through the Folding@home distributed computing project to create the world's first Exascale computer and simulate protein dynamics. An unprecedented 0.1 seconds of simulation of the viral proteome reveal how the spike complex uses conformational masking to evade an immune response, conformational changes implicated in the function of other viral proteins, and cryptic pockets that are absent in experimental structures. These structures and mechanistic insights present new targets for the design of therapeutics.

Circulating SARS-CoV-2 spike N439K variants maintain fitness while evading antibody-mediated immunity

New mutations that enhance the affinity of SARS-CoV-2 spike protein for human ACE2 and potentially pose threats to antibody-based therapeutics and vaccines for COVID-19 are already emerging in the wild. We characterize and describe sentinel mutations of SARS-CoV-2 in the wild that herald challenges for combatting COVID-19, and use simulations of the RBD-ACE2 interface on Folding@home to biophysically characterize why these mutations can lead to enhanced affinity.

Standard state free energies, not pK_a s, are ideal for describing small molecule protonation and tautomeric states

Here, we demonstrate how the physical nature of protonation and tautomeric state effects means that the standard state free energies of each microscopic protonation/tautomeric state at a single pH is sufficient to describe the complete pH-dependent microscopic and macroscopic populations. We introduce a new kind of diagram that uses this concept to illustrate a variety of pH-dependent phenomena, and show how it can be used to identify common issues with protonation state prediction algorithms. As a result, we recommend future blind prediction challenges utilize microstate free energies at a single reference pH as the minimal sufficient information for assessing prediction accuracy and utility.

Is structure based drug design ready for selectivity optimization?

We asked whether the similarity of binding sites in related kinases might result in a fortuitous cancellation of errors in using alchemical free energy calculations to predict kinase inhibitor selectivities. Surprisingly, we find that even distantly related kinases have sufficient correlation in their errors that predicting changes in selectivity can be much more accurate than predicting changes in potency due to this effect, and show how this could lead to large reductions in the number of molecules that must be synthesized to achieve a desired selectivity goal.

Chodera JD and Noé F

Probability distributions of molecular observables computed from Markov models.

II. Uncertainties in observables and their time-evolution

A simple Bayesian approach for the modeling of statistical uncertainties in kinetic and equilibrium quantities computed from Markov state models of biomolecular dynamics.

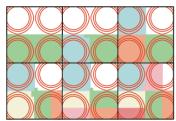

Biophysical Journal 98:3062, 2010 · DOI

Adelman JL, Chodera JD, Kuo IW, Miller TF, and Barsky D

The mechanical properties of PCNA: Implications for the loading and function of a DNA sliding clamp

Molecular simulations of the PCNA clamp responsible for DNA polymerase processivity show a surprisingly small energetic penalty for the deformation required for clamp loading. Featured on issue cover.

Journal of Chemical Physics 131:045106, 2009 · DOI

Bacallado S, Chodera JD, and Pande VS

Bayesian comparison of Markov models of molecular dynamics with detailed balance constraint

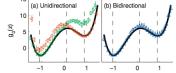

A Bayesian scheme for comparing state space decompositions for Markov state models of biomolecular dynamics that incorporates the fact that physical systems must obey detailed balance. This paper utilizes recent results from Markov chain theory on edge-reinforced random walks.

Journal of Chemical Physics 131:134110, 2009 · DOI

Minh DDL, Chodera JD

Optimal estimators and asymptotic variances for nonequilibrium path-ensemble averages

We derive an optimal estimator and corresponding statistical uncertainties for inferring expectations of bidirectional nonequilibrium processes. These estimators have widespread applicability in single-molecule biophysical force-spectroscopy experiments and nonequilibrium molecular simulations.

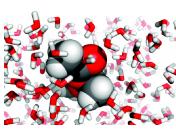

Journal of Chemical Physics 129:124105, 2008 · DOI

Shirts MR, Chodera JD

Statistically optimal analysis of samples from multiple equilibrium states

We present a highly general, statistically optimal approach for producing estimates of free energies and equilibrium expectations from multiple simulations that provably extracts all useful information from the data.

Journal of Medicinal Chemistry 51:769, 2008 · DOI

Nicholls A*, Mobley DL*, Guthrie JP, Chodera JD, and Pande VS

Predicting small-molecule solvation free energies: A blind challenge test for computational chemistry

A blind evaluation of the accuracy of alchemical free energy methods for computing gas-to-water transfer free energies (solvation free energies) of small molecules demonstrates that modern forcefields are likely sufficiently accurate to be useful in drug design.

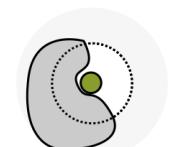

Journal of Physical Chemistry B 112:938, 2008 · DOI

Mobley DL, Dill KA, and Chodera JD

Treating entropy and conformational changes in implicit solvent simulations of small molecules

An quantitative examination of how much conformational entropy contributes to hydration free energies of small molecules, with implications for ligand binding.

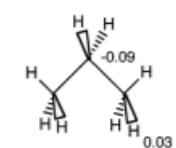

Journal of Physical Chemistry B 111:13052, 2007 · DOI

Shirts MR*, Mobley DL*, Chodera JD, and Pande VS

Accurate and efficient corrections for missing dispersion interactions in molecular simulations

We identify a major source of systematic error in absolute alchemical free energy calculations of ligand binding and show how a simple procedure can inexpensively and accurately eliminate it.

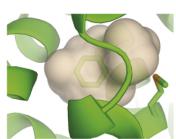

Journal of Physical Chem B 111:2242, 2007 · DOI

Mobley DL, Dumont E, Chodera JD, Bayly CI, Cooper MD, and Dill KA

Comparison of charge models for fixed-charge force fields: Small-molecule hydration free energies in explicit solvent

We compare a number of popular methods for deriving charge models for small molecules, deriving lessons about best practices for accurate simulations.

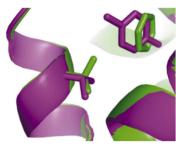

Journal of Molecular Biology 371:1118, 2007 · DOI

Mobley DL, Graves AP, Chodera JD, McReynolds AC, Shoichet BK, and Dill KA

Predicting absolute ligand binding free energies to a simple model site

We show how alchemical free energy calculations are capable of accurate blind prediction of small-molecule binding affinities to a simple model protein binding site.

Journal of Chemical and Theoretical Computation 3:1231, 2007 · DOI

Mobley DL, Chodera JD, and Dill KA

Confine-and-release method: Obtaining correct binding free energies in the presence of protein conformational change

We present a general scheme for obtaining correct ligand binding affinities when protein conformational change is implicated in ligand binding.

Journal of Chemical Physics 126:155101, 2007 · DOI

Chodera JD*, Singhal N*, Swope WC, Pitera JW, Pande VS, and Dill KA

Automatic discovery of metastable states for the construction of Markov models of macromolecular conformational dynamics

Proposing one of the first automated algorithms for discovering kinetically metastable states of biomolecules from molecular simulations, this paper shows how many biomolecules can possess numerous distinct long-lived conformational states even though the equilibrium populations of these states may be too small for standard structural biology techniques to detect.

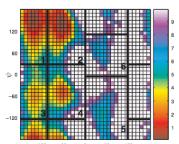

Proceedings of the National Academy of Sciences 104:11987, 2007 · DOI

Ozkan SB, Wu GA, Chodera JD, and Dill KA

Protein Folding by Zipping and Assembly

A review of the utility of the proposed zipping and assembly mechanism for the concomitant formation of secondary and tertiary structure in protein folding for predicting folding pathways and native structures.

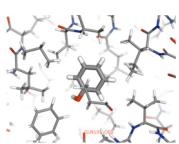

Journal of Chemical Theory and Computation 3:26, 2007 · DOI

Chodera JD, W. C. Swope, J. W. Pitera, C. Seok, and K. A. Dill

Use of the weighted histogram analysis method for the analysis of simulated and parallel tempering simulations

The weighted histogram analysis method (WHAM), a mainstay of molecular dynamics simulation analysis, is thoroughly explained and modernized for the analysis of simulated and parallel tempering simulation data.

Journal of Chemical Physics 125:084902, 2006 · DOI

Mobley DL, Chodera JD, and Dill KA

On the use of orientational restraints and symmetry corrections in alchemical free energy calculations

We illustrate how orientational restraints can be used to greatly reduce the computational effort in alchemical calculations of ligand binding free energies, and clarify how symmetry corrections are necessary when molecules contain symmetric or pseudosymmetric substituents.

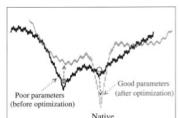

Multiscale Modeling and Simulation 5:1214, 2006 · DOI

Chodera JD, Swope WC, Pitera JW, and Dill KA

Long-time protein folding dynamics from short-time molecular dynamics simulations

We show how the long-time dynamics of biomolecular systems can be recapitulated from statistics collected from short molecular simulations sampling transitions between kinetically metastable states.

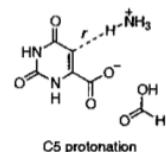

Journal of Computational Chemistry 24:89, 2003 · DOI

Seok C, Rosen JB, Chodera JD, Dill KA

MOPED: Method for optimizing physical energy parameters using decoys

We propose a new way to optimize parameters for a physical energy function using decoy structures for protein folding studies.

Journal of the American Chemical Society 123:12837, 2001 · DOI

Lee TS*, Chong LT*, Chodera JD, and Kollman PA

An alternative explanation for the catalytic proficiency of orotidine 5'-phosphate decarboxylase

A combined QM and MD analysis of potential plausible mechanisms to explain the enormous catalytic acceleration of one of the most proficient enzymes known.

Funding

All funding sources are publicly available online at <http://choderlab.org/funding>

ACTIVE

Single-Investigator Grants

Collaborative Grants

NIH NIAID U19 1U19AI171399 (MPI: Chodera [Contact PI]; Alpha Lee, PostEra; Peter Sjö, DNDI)
AI-driven Structure-enabled Antiviral Platform (ASAP) co-Is: Karla Kirkegaard (Stanford), Matt Bogyo (Stanford), Jesse Bloom (Fred Hutch), Frank von Delft (Diamond Light Source), Martin Walsh (Diamond Light Source), Alpha Lee (PostEra), Nir London (Weizmann), Ed Griffen (MedChemica), Laurent Fraisse (DNDI), Haim Barr (Weizmann), Daren Fearon (Diamond Light Source), Kris White (Mount Sinai), Adolfo García-Sastre (Mount Sinai), Randy Albrecht (Mount Sinai)
05/16/2022 – 04/30/2025

The goal of this antiviral drug discovery (AViDD) Center is to use an AI-accelerated structure-enabled discovery platform to build a pipeline of novel oral antivirals against coronaviruses, flaviviruses, and picornaviruses using an open science, IP-free discovery paradigm to act as a nexus for global antiviral discovery.

Total federal funds awarded: \$67,662,387

Total direct costs: \$49,000,085

Total F&A for MSKCC: \$18,662,302 Eligible for non-competitive renewal for two more years for an additional \$42M.

NIH R01 1R01GM132386 (MPI: John Chodera; Michael Shirts, University of Colorado [Contact PI])

Open data-driven infrastructure for building biomolecular force fields for predictive biophysics and drug design
co-Is: David Mobley (UCI), Lee-Ping Wang (UC Davis), Michael Gilson (UCSD)

The goal of this project is to develop a modern open infrastructure for building fully consistent biopolymer and small molecule force fields for drug design and predictive biophysical modeling.

3/1/2020 – 2/29/2024

\$20,684 annual direct costs to the Chodera lab

Note: Chodera was a PI of this multi-PI/PD grant for the first year, but moved to co-I status in subsequent years due to NIGMS limit two active GMS PI grants.

NIH 3R01GM132386-02S1 (PI: Michael Shirts, University of Colorado Boulder)

Supplement: Open data-driven infrastructure for building biomolecular force fields for predictive biophysics and drug design
co-Is: David Mobley (UCI), Lee-Ping Wang (UC Davis), Michael Gilson (UCSD)

The goal of this project is to support continued development of OpenMM, transition to a community governance and distributed development model, and extension to integrate physical and machine learning models to enable genomic-scale biomolecular modeling, simulation, and prediction.

3/1/2021 – 2/29/2024

\$132,694 annual direct costs for this supplement

JDC wrote this proposal to secure additional funding for a critical community resource (QCArchive/QCFractal) he will help direct.

NIH 1R01GM140090 (PI: Tom Markland, Stanford University)

OpenMM: Scalable biomolecular modeling, simulation, and machine learning

co-I: Gianni de Fabritiis (Universitat de Pompeu Fabra, Barcelona)

The goal of this project is to support continued development of OpenMM, transition to a community governance and distributed development model, and extension to integrate physical and machine learning models to enable genomic-scale biomolecular modeling, simulation, and prediction.

7/1/2021 – 3/31/2025

\$36,685 annual direct costs to the Chodera lab

BIH Einstein Visiting Professorship at the Charité Berlin

Computational polypharmacology: A new paradigm for selectively promiscuous kinase inhibitors

The goal of this project is to develop structure-informed machine learning approaches to predicting kinase inhibitor polypharmacology for computer-guided small molecule design.

1/1/2019 – 12/31/2024

EUR150,000 annual direct costs to Chodera (via Charité) for Berlin working group (with six-month no-cost extension)

Fellowships

Sukrit Singh // Postdoctoral Fellow

Damon Runyon Quantitative Biology Fellowship

5/1/2022 – 4/30/2025

\$240,000 total stipend support

Benjamin Kaminow // CBM Graduate Student
NSF Graduate Research Predoctoral Fellowship (GRFP)
9/1/2023 – 8/31/2026
\$49,000 annual stipend support

PENDING

Single-Investigator Grants and Contracts

NIH NIGMS R35 GM152017-01 (PI: Chodera)

12/01/2023 – 11/30/2028

Teaching free energy calculations to learn

This proposal would support the development and integration of advanced machine learning methods for alchemical free energy calculations

\$499,344 annual direct costs to the Chodera lab

Impact Score: 18

NIH DP1OD037515-01 (PI: Chodera)

8/01/2024 – 7/31/2029

Redesigning drug design

This proposal would support the development of autonomous small molecule drug discovery technologies

\$700,000 annual direct costs to the Chodera lab

HHMI 2024 Investigator Competition (PI: Chodera)

9/1/2024 – 8/31/2031

TBD annual direct costs to the Chodera lab over seven years

Collaborative Grants

NIH NIGMS R01 HG013328-01A1 (PI: Morris)

7/1/2023 – 6/30/2027

Post-transcriptional Regulatory Networks

The role of the Chodera lab in this project is to co-supervise a student in the development of machine learning models for protein:RNA structure and affinity prediction

\$15,749 annual direct costs to the Chodera lab

Impact score 25, Percentile 13th, NHGRI council meeting scheduled for 5/2023

NIH NCI R01 GM145739-01 (MPI: Chiosis/Gewirth)

4/1/2022 – 3/31/2027

Mechanistic investigations into Glyc62GRP94 epichaperomes

The role of the Chodera lab in this project is to use MD simulations to uncover the effect of the N-glycan on GRP94 structure and ligand binding.

\$50,000 annual direct costs to the Chodera lab

Impact Score:28; Percentile:16, NIGMS declined to fund due to "well-funded lab" rule; A1 submission with PI: Gewirth scored and moved to "for consideration", with funding decision 6/2023

Fellowships

None

COMPLETED

Single-Investigator Grants and Contracts

Vir Biosciences Sponsored Research Agreement SK2019-0582

Development of alchemical free energy methods for predicting the impact of point mutations on antigen and antibody affinities

The goal of this project is to develop alchemical free energy methods for predicting the impact of point mutations on antigen and antibody affinities for SARS-CoV-2.

8/1/2019 – 7/31/2023

\$55,556 annual direct costs

Interline Therapeutics Sponsored Research Agreement SK2020-0898

Identification of key biophysical interactions in ligase-substrate recognition

The goal of this project is to identify key biophysical interactions necessary for ligase-substrate recognition and developing quantitative accurate open source tools for predicting changes in affinity associated with point mutations in either ubiquitin ligases or their substrate peptides.

1/15/2021 – 4/15/2023

\$187,998 direct costs

NIH R01 GM121505

The role of reorganization energy in achieving selective kinase inhibition

The goal of this project is to probe the role of protein reorganization energy in achieving selectivity in targeted kinase inhibition with small molecules.

9/1/2017 – 8/31/2022

\$196,250 annual direct costs to the Chodera lab

Relay Therapeutics Collaboration SK2018-0162

Development of efficient open source cloud-enabled free energy based lead optimization algorithms and integrative Bayesian model of experimental biophysical and molecular simulation data

The goal of this project is to develop open source scalable cloud workflows for lead optimization using relative alchemical free energy calculations, as well as Bayesian integrative modeling techniques for experimental biophysical data and molecular simulations.

4/5/2018 – 4/4/2023

\$124,828 annual direct costs

Bayer Sponsored Research Agreement SK2019-1289

Development of a combined machine learning / alchemical free energy approach to predict the impact of mutations on small molecule kinase inhibitor binding

The goal of this project is to develop open source scalable free energy and machine learning workflows in collaboration with the Volkamer lab (Charité Berlin) to predict kinase mutations small molecule therapeutics may be effective against.

3/1/2020 – 4/30/2022

\$117,105 annual direct costs to the Chodera lab

NSF RAPID CHE2033426

RAPID: Identifying Biophysical Determinants of Binding to the SARS-CoV-2 Main Viral Protease

The goal of this proposal is to assess the accuracy of large-scale alchemical free energy calculations in identifying potent inhibitors of the SARS-CoV-2 main viral protease (Mpro) with the COVID Moonshot.

7/1/2020 – 6/30/2021

\$112,994 direct costs to Chodera lab

Entasis Therapeutics Sponsored Research Agreement SK2018-0163

Development of efficient equilibrium and nonequilibrium algorithms for predicting small molecule porin permeation with potential of mean force methods

The goal of this project is to develop algorithms and open source tools for efficient equilibrium and nonequilibrium potential of mean force calculations for bacterial porins.

4/5/2018 – 4/5/2019

\$74,074 annual direct costs to the Chodera lab

Parker Institute for Cancer Immunotherapy Pilot Grant

Physics-based computational prediction of cancer-associated mutant MHC class II epitopes

The goal of this project is to develop algorithms and open source tools for efficient computation of MHC class II epitope binding affinities.

4/2/2018 – 4/1/2019

\$75,000 annual direct costs to the Chodera lab

NSF D3SC EAGER CTMC

A probabilistic framework for automated forcefield parameterization from experimental datasets

The goal of this project is to develop a scalable Bayesian inference infrastructure to parameterize molecular mechanics forcefields using experimental datasets.

9/1/2017 – 8/31/2019

\$52,030 annual direct costs to the Chodera lab

Silicon Therapeutics Sponsored Research Agreement

Development of efficient open source free energy based lead optimization algorithms

The goal of this project is to develop open source scalable parallel workflows for lead optimization using relative alchemical free energy calculations.

5/17/2017 – 11/17/2018

\$48,655 annual direct costs to the Chodera lab

Merck KGaA Sponsored Research Agreement

Developing automated workflows for absolute alchemical free energy calculations

The goal of this project is to develop open source automated workflows using absolute alchemical free energy calculations for use in prioritizing compounds for synthesis in drug discovery applications.

7/26/2016 – 1/25/2019

\$90,273 annual direct costs to the Chodera lab

Astra-Zeneca iMed Sponsored Research Agreement

Evaluating the potential for Markov state models of conformational dynamics to advance quantitative prediction of thermodynamics and kinetics of selective kinase inhibitors

The goal of this project is to evaluate the potential for Markov state models of conformational dynamics to quantitatively predict the thermodynamics and kinetics of selective kinase inhibitors to CK2 and SYK.

7/30/2015 – 1/30/2017

\$117,505 annual direct costs to the Chodera lab

Gerstner Family Foundation

Louis V. Gerstner, Jr. Young Investigator Award

Dates: 2/1/2013 – 1/30/2016

\$75,000 annual direct costs

MSKCC Functional Genomics Initiative (FGI) Rapid Response Grant

Biophysical characterization of clinically-identified kinase mutations

The goal of this project is to quantify the impact of clinically-identified kinase domain mutations on FDA-approved selective kinase inhibitor binding.

4/1/2016 – 3/31/2016

\$25,000 annual direct costs

MSKCC Functional Genomics Initiative (FGI) Rapid Response Grant

Biophysical characterization of clinically-identified K-Ras mutants

The goal of this project is to biophysically characterize clinically-identified K-Ras mutants.

7/1/2016 – 6/30/2016

\$25,000 annual direct costs

Fellowships

Dominic Rufa // TPCB Graduate Student

MolSSI Seed Software Fellowship

1/1/2022 – 6/30/2022

\$20,000 stipend support

Yuanqing Wang // PBSB Graduate Student

Anagenex Open Science Fellowship

9/1/2021 – 2/28/2022

\$21,750 stipend support

Karmen Čondić-Jurkić, Postdoctoral Research Fellow

Open Force Field Consortium Postdoctoral Fellowship

4/1/2020 – 3/31/2021

\$88,864.10 stipend, supplies, and travel support

Ivy Zhang CBM Graduate Student

MolSSI COVID-19 Seed Software Fellowship

7/1/2020 – 12/31/2020
\$20,000/year stipend support

Hannah Bruce Macdonald, Postdoctoral Fellow
MolSSI Investment Software Fellowship
7/1/2019 – 12/31/2020
\$50,000/year stipend support

Marcus Wieder, Postdoctoral Research Fellow
Austrian Schrödinger Stipendium
10/1/2018 – 9/30/2019
Fellowship recipient direct paid

Simon Boothroyd, Postdoctoral Research Fellow
XtalPi / Open Force Field Consortium Distinguished Postdoctoral Fellowship
10/1/2018 – 9/30/2019
Fellowship recipient direct paid

Andrea Rizzi, CBM Graduate Student
MolSSI Open Force Field Predoctoral Fellowship
1/1/2019 – 6/30/2019
\$20,000/six months stipend support

Rafal P. Wiewiora, TPCB Graduate Student
DOD Peer-Reviewed Cancer Research Program Award
8/15/2017 – 8/14/2019
\$75,000/year for stipend and supplies

Karmen Čondić-Jurkić, Postdoctoral Research Fellow
Open Force Field Consortium Postdoctoral Fellowship
1/1/2019 – 6/30/2019
\$60,628 stipend and travel support

Chaya Stern, TPCB Graduate Student
MolSSI Phase II Fellowship
7/1/2018 – 12/31/2018
\$40,000/year stipend support

Chaya Stern, TPCB Graduate Student
MolSSI Phase I Fellowship
7/1/2018 – 12/31/2018
\$40,000/year stipend

Chaya Stern, TPCB Graduate Student
NSF Graduate Research Fellowship
8/1/2015 – 7/30/2018
\$32,000/year stipend support

Mehtap Isik, TPCB Graduate Student
Doris J. Hutchison Fellowship
7/1/2017 – 6/30/2018
\$38,668/year stipend support

Gregory A. Ross, Postdoctoral Fellow
Molecular Software Sciences Institute (MolSSI) Graduate Research Fellowship
\$50,000/year stipend support

Steven Albanese, GSK Graduate Student
Summer Internship, Schrödinger
Summer 2017

Ariën S. Rustenburg, PBSB Graduate Student
Summer Internship, Genentech
Summer 2015

Andrea Rizzi, CBM Graduate Student
Tri-I CBM Student Stipend Assistance
\$13,500/year stipend support

Collaborative Grants

NIH R01 GM124270 (PI: David Mobley, UCI)

Advancing predictive physical modeling through focused development of model systems to drive new modeling innovations

The goal of this project is to enable blind community challenges that drive progress toward quantitative accuracy in the field of computational physical modeling of drug-receptor interactions.

9/10/2018 – 8/31/2023

\$42,711 annual direct costs to the Chodera lab

NSF CHI 1904822 (MPI: John Chodera, David Minh)

Collaborative Research: CDS&E: Elucidating Binding using Bayesian Inference to Integrate Multiple Data Sources

The goal of this project is to develop a scalable approach to Bayesian inference from biophysical experiments

9/1/2019 – 8/31/2023

\$47,327 annual direct costs to the Chodera lab

Chan Zuckerberg Initiative – Essential Open Source Software for Science (PI: Tom Markland, Stanford University)
co-I: Gianni de Fabritiis (Universitat de Pompeu Fabra, Barcelona)

OpenMM: Key infrastructure for biomolecular modeling and simulation

The goal of this project is to support continued development of OpenMM, transition to a community governance and distributed development model, and extension to integrate physical and machine learning models to enable genomic-scale biomolecular modeling, simulation, and prediction.

9/1/2020 – 4/1/2021

JDC wrote this proposal to secure funding for a key community infrastructure project that his lab depends upon.

\$180,000 total direct costs to support this project

Functional Genomics Initiative (FGI)

Integrated Approaches Annotate Functions of Cancer-associated H3K36 Methyltransferases

The goal of this project is to develop approaches for using large-scale physical modeling and biochemical experiments to annotate the functions of clinical cancer mutations.

1/1/2019 – 12/31/2020

co-PI: Minkui Luo

\$125,000 annual direct costs to the Chodera lab

2014 Functional Genomics Initiative (PI: James Hsieh, MSKCC)

Characterization of Cancer-derived mTOR Mutations for Precision Therapeutics

The goal of this project is to understand the mechanism underlying clinically-identified mTOR activating mutants and evaluate the potential for rapalog therapy to aid the 2% of cancer patients harboring mTOR mutations.

5/1/2015 – 4/30/2017

\$118,000

2014 STARR Cancer Consortium (PI: Minkui Luo, MSKCC)

Designing sinefungin scaffolds as specific protein methyltransferase inhibitors

The goal of this project is to use computational techniques that explicitly incorporate protein flexibility to design selective inhibitors for protein lysine methyltransferases.

1/1/2015 – 6/30/2017

\$125,000

Personnel

CURRENT MEMBERS

Postdocs

- Sukrit Singh, PhD Washington University St. Louis (6/1/2021–)
Damon Runyon Quantitative Biology Fellow
Selective inhibition and drug resistance in clinical kinase inhibitors

Graduate Students

- Dominic Rufa (4/1/2019–)
Tri-Institutional Program in Computational Biology and Medicine (CBM)
Machine learning for alchemical free energy calculations
- Alexander Payne (8/1/2020–) [co-supervised with Rich Hite, MSKCC Structural Biology Program]
Program in Physiology, Biophysics, and Systems Biology (PBSB)
Combining cryo-EM with Markov state models, virtual screening, and free energy calculations for drug discovery
- Viktor Belay (8/1/2020–) [co-supervised with Rich Hite, MSKCC Structural Biology Program]
Program in Physiology, Biophysics, and Systems Biology (PBSB)
Combining cryo-EM with Markov state models, virtual screening, and free energy calculations for drug discovery
- Michael Retchin (7/1/2021–)
Tri-Institutional Program in Computational Biology and Medicine (CBM)
New technologies for autonomous drug discovery
- Benjamin Kaminow (1/1/2022–)
Tri-Institutional Program in Computational Biology and Medicine (CBM)
Structure-enabled machine learning for drug discovery
- Jessica White (7/1/2022–)
Tri-Institutional Program in Computational Biology and Medicine (CBM)
Structure-enabled machine learning for kinase-directed drug discovery and resistance
- Kendall Lemons (7/1/2022–)
Tri-Institutional Program in Computational Biology and Medicine (CBM)
Structure-enabled machine learning for antiviral drug discovery

Software Scientists

- Iván Pulido (8/2021–)
Alchemical free energy calculation software infrastructure; software infrastructure support for ASAP
- Jenke Scheen (8/2022–) via [OMSF](#)
Computer-aided drug discovery software infrastructure lead for ASAP
- Mike Henry (1/2021–)
Alchemical free energy calculation software infrastructure; software infrastructure support for ASAP
- David Dotson (1/2021–) via [OMSF](#)
Foldinghome distributed computing and alchemical free energy software infrastructure support for ASAP
- Hugo MacDermott-Opeskin (1/2023–) via [OMSF](#)
Foldinghome distributed computing and alchemical free energy software infrastructure support for ASAP

Research Associates

- Erica Goldberger (7/1/2019–)
Lab manager; Automated measurements of small molecule binding affinities to model drug targets for improving quantitative predictions for drug discovery

PAST TRAINEES

My lab trains interdisciplinary scientists to tackle the most challenging problems in drug discovery.

Postdocs

- David Schaller, PhD Freie Universität Berlin (7/1/2020–7/31/2022) (**Berlin group**)
Current position: Associate Scientist, [Nuvisan](#)
- Ana Silveira, PhD Federal University of Rio de Janeiro (8/1/2018–7/31/2019)
Current position: Head of Molecular Simulation, [Psivant Therapeutics](#)
- Jiaye Guo, PhD Stony Brook University (10/1/2018–5/31/2021)
Current position: Senior Scientist I, [Schrodinger](#)
- Simon Boothroyd, PhD Lancaster University (11/1/2018–10/31/2019)
Current position: Senior Researcher, Scientific Programmer, [Psivant Therapeutics](#)
- William Glass, PhD Southampton (5/1/2020–7/31/2021)
Current position: Molecular Dynamics Research Scientist, [Exscientia](#)
- Jaime Rodríguez-Guerra Pedregal, PhD Autonomous University of Barcelona (4/1/2019–5/31/2021) (**Berlin group**)
Current position: Software Engineer, [Quansight](#)
- Karmen Čondić-Jurkić, PhD Friedrich Alexander University, Erlangen (4/6/2019–)
Current position: Executive Director and Co-Founder, [Open Molecular Software Foundation](#)
- Hannah Bruce Macdonald, PhD University of Southampton (10/1/2018–9/30/2020)
Current position: Senior Scientist I, [Merck Sharp & Dohme \(MSD\)](#)
- Marcus Wieder, PhD University of Vienna (9/1/2018–4/16/2020)
Current position: Faculty, [University of Vienna](#)
- Levi N. Naden (until 8/10/2018)
Current position: Software Scientist at the NSF [Molecular Sciences Software Institute \(MolSSI\)](#)
- Sonya M. Hanson (until 6/30/2017)
Next position: Postdoctoral Researcher with Joachim Frank, [Columbia University](#)
Current position: Group Leader and Research Scientist, Center for Computational Biology, [Flatiron Institute](#), Simons Foundation, NYC
- Gregory Ross (until 6/30/2017)
Current position: Principal Scientist, [Schrödinger](#)
- David W. H. Swenson (until 12/30/2015)
Current position: Software Scientist, [Open Free Energy Consortium](#)
- Daniel L. Parton (until 8/31/2015)
Current position: Lead Data Scientist, [Bardess Group](#)
- Kyle A. Beauchamp (until 6/12/2015)
Current position: Senior Director of Data Science, [Tempus](#)
- Jan-Hendrik Prinz (until 1/30/2015)
Current position: Digital Solutions Architect, [Keylight GmbH](#)
- Sarah E. Boyce (until 10/31/2013)
Current position: Director, [Schrödinger](#)

Graduate Students

- Melissa Boby (8/1/2016–11/8/2023)
Current position: Drug Discovery Fellow, [DE Shaw Research](#)
- Ivy Zhang (8/1/2018–1/16/2024)
Current position: Scientist, Computer Aided Drug Design, [Bristol Myers Squibb](#)
- Yuanqing Wang (7/1/2018–3/13/2022)
Program in Physiology, Biophysics, and Systems Biology (PBSB)
Free and open source parameterization of protein-small molecule force fields
Current position: Independent Simons Postdoctoral Fellow, Department of Chemistry, NYU; Schmidt Science Fellow
- Talia Kimber (4/1/2019–2/28/2023) [co-supervised with Andrea Volkamer, Charité Berlin]
Charité Universitätmedizin (supervisor: Andrea Volkamer)
Freie Universität Berlin, Computer Science PhD program (supervisor: Frank Noé)
Machine learning for optimizing affinity/selectivity and predicting resistance
Current position: Data Scientist, Swiss Federal Government

- Joshua Fass (9/1/2015–11/9/2020)
Tri-Institutional Program in Computational Biology and Medicine (CBM)
Current position: *Scientist, Relay Therapeutics*
- Mehtap Isik (6/1/2015–9/11/2020 anticipated)
Tri-Institutional Program in Chemical Biology (TPCB)
Current position: *Scientist, Computational Chemistry, Moderna*
- Rafal Wiewiora (6/1/2015–8/31/2020)
Tri-Institutional Training Program in Chemical Biology (TPCB)
Current position: *Scientist, Roivant Sciences*
- Ariën Sebastian Rustenburg (10/1/2013–10/19/2018)
Program in Physiology, Biophysics, and Systems Biology (PBSB)
Current position: *DevOps Engineer, Software for Chemistry & Materials, SCM*
- Andrea Rizzi (9/1/2015–12/31/2019)
Tri-Institutional Program in Computational Biology and Medicine (CBM)
Current position: *Postdoctoral Fellow, Michele Parrinello Group, ETH Zürich*
- Chaya Stern (4/01/2014–6/30/2020)
Tri-Institutional Training Program in Chemical Biology (TPCB)
Current position: *Senior Principal Scientist, Odyssey Therapeutics*
- Steven Albanese (6/1/2015–3/31/2019)
Gerstner Graduate Program (GSK)
Current position: *Principal Scientist II, Schrödinger*
- Patrick B. Grinaway (7/1/2013–12/31/2018)
Program in Physiology, Biophysics, and Systems Biology (PBSB)
Current position: *Scientist, Onai*
- Julie M. Behr (1/10/2014–12/31/2016)
Tri-Institutional Program in Computational Biology and Medicine (CBM)
Current position: *Data Scientist II, ROME Therapeutics*

Technicians

- Liza Casella (1/19/2021–11/6/2021)
Current position: *Research Associate, Kingdom Supercultures*
- Binisha Karki (8/1/2019–8/28/2020)
Current position: *Research Associate, BioNTech*
- Lucelenie Rodriguez (7/1/2015–12/31/2016; 12/4/2017–7/20/2018)
Current position: *Medical student, NYU School of Medicine*
- Erin Grundy (6/1/18–7/31/2019)
Current position: *Graduate student, George Washington University*
